## Sprint #4 Review

2-23 / 3-8

The goal of this sprint was to build and finish our minimum viable product. We also had to finish our presentation and include appropriate comments for testing and required documentation. Our team did a great job of finishing strong. We got most of our tasks done and worked together to finish up the final product.

What we finished:

**T1** - Testing database queries

**T2** - Building on current user interface for better presentability

**T3** - Load balancers for scalability

**T4** - Come up with finalized design

**T5** - Use react to come up with user interface

What we didn't finish:

**T6** - Write system tests and documents

Closing remarks:

Although we got most of task 6 done, we did not completely finish it. We were consistently able to meet the smaller goals throughout our sprints to come up with the minimum viable product and the final product. Our team did a great job of communicating with each other and anticipating issues that may arise. Our TA did an excellent job of ensuring that we met our deadlines and weren't falling behind.
